Note: Annual Production Capacity only refers to the reported maximum production capability of the facility once it gets built.

The biodiesel companies on this map are under construction. Companies that are expanding their operations are designated with an “E” in the state column of the table.

The annual production capacity for plants under expansion represents the incremental increase in production resulting from the expansion. For example, if the existing capacity of a plant actively producing biodiesel is 3 million gallons per year (found on Existing Plant Map) and their expansion project is 9 million gallons per year their total annual production capacity will be 12 million gallons per year after the expansion is complete.

Anticipated annual production capacity for the plants listed in this document, including the plants that chose not to list their production capacity is 1.37 billion gallons per year. It is important to note that production capacity differs from the actual number of gallons sold. A graph illustrating biodiesel demand can be found at http://www.nbb.org/pdf_files/fuelfactsheets/Production_Graph_Slide.pdf

Contacts for many of these companies can be found on the National Biodiesel Board website at <http://www.biodiesel.org/members/>

Multi Feedstock is a term used to describe plants that can use a variety of feedstocks. In most cases, this means a plant is able to process vegetable oils, animal fats, recycled cooking oil or yellow grease.

Note: Annual Production Capacity only refers to the reported maximum production capability of the facility once it gets built.
